

What is Hydro-Seeding?

Hydro-Seeding is a process used by professionals in many areas to install premium lawns and is rapidly gaining recognition throughout the country. It is a process of mixing seed, fertilizer and fiber mulch with water in correct portions inside a tank, then spraying the homogeneous mixture onto lawn areas.

What are the benefits of Hydro-Seeding?

- Seeds Germinate Faster
- Higher Percentage of Seed Germination
- Higher Grass Plant Survival
- Greatly Reduced Soil Erosion
- Uniform Distribution of Seed, Fertilizer and Mulch
- Versatility – Easier to seed difficult areas; irregular plots, slopes, or berms, ditches and narrow strips
- Seed Mixes are tailored to the sight, depending on sun exposure and planned usage of the lawn
- No masking necessary for walkways, flower beds, walls or construction obstacles
- Mulch turns to humus and becomes an integral part of soil
- A fuller, more plush lawn develops
- Less than HALF the cost of sod!
